## FORMULAS FOR CALCULATION

$$
\begin{array}{ll}
\mathbf{v}_{(\mathrm{th})}=\sqrt{2 \mathrm{gH}} & \mathrm{H}=\frac{\mathrm{V}^{2}}{2 \mathrm{~g}} \\
\mathrm{E}=\mathbf{m g H} & \mathrm{e}=\frac{\mathbf{m V}^{2}}{2} \\
\mathrm{v}=\frac{\mathrm{d}}{\mathrm{t}} &
\end{array}
$$

$\mathbf{F}=\mathbf{m a}$

System friction (\%) $=\frac{\mathbf{V}_{(t h)}-\mathbf{V}_{(\mathrm{pr})}}{\mathbf{V}_{(\mathrm{th})}}$

RESPECTIVELY WHERE:

| $a=$ acceleration $\left(\mathrm{m} / \mathrm{sec}^{2}\right)$ | $H=$ drop height $(\mathrm{m})$ |
| :--- | :--- |
| $\mathrm{e}=$ energy (joules) | $V_{(\mathrm{pr})}=$ practical velocity $(\mathrm{m} / \mathrm{sec})$ |
| $\mathrm{m}=$ mass $(\mathrm{kg})$ | $V_{(\mathrm{th})}=$ theoretical velocity $(\mathrm{m} / \mathrm{sec})$ |
| $F=$ force $($ Newton $)$ | $d=$ distance $(\mathrm{mm})$ |
| $g=9.8068 \mathrm{~m} / \mathrm{sec}^{2}$ | $\mathrm{t}=$ time (millisecond) |
